"Identification of variable domains of the attachment (G) protein of subgroup A respiratory syncytial viruses.";
J. Gen. Virol. 72:2091-2096(1991).
-!- FUNCTION: UNLIKE THE OTHER PARAMYXOVIRUS ATTACHMENT PROTEINS, THE RESPIRATORY SYNCYTIAL VIRUS G PROTEIN LACKS BOTH NEURAMINIDASE AND HEMAGGIUTINATING ACTIVITIES.
-!- SUBCELLULAR LOCATION: EXPRESSED ON THE SURFACE OF THE INFECTED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

c. FUNCTION: COATE THE BETTHELIA OF THE INTESTINES, AIRWAYS, AND OTHER WICHS MEMBRARAS-CONTAINING ORGANS. THOUGHT TO PROVIDE A PROTECTIVE, IUBRICATING BARRIER AGAINST PARTICLES AND INFECTIOUS AGBNESS AT MUCUSAL SURFACES.
c. 1- SUBCELLULAR LOCATION: Secreted.
c. 1- SUBCELLULAR LOCATION: Secreted.
c. 1- SUBCELLULAR LOCATION: Secreted.
c. 1- SUBCELLULAR LOCATION SMALL INTESTINE, COLONIC TUMORS, BRONCHUS, CERVIX AND GALL BLADDER.
c. 1- SUBCELLULAR ESIDIES ARE INVOLVED IN INTRACHAIN OR BRONCHUS, CERVIX AND GALL BLADDER.
c. 1- SUBCHIALD SMADNE DIFFERENT ALLELES.
c. 1- POLYMORPHISM: THE WUMBER OF REPEATS IS HIGHLY POLYMORPHIC AND VARIES AMONG DIFFERENT ALLELES.
c. 1- SIMILARITY: Contains 1 C-terminal cystine knot-like) domain.
c. 1- SIMILARITY: Contains 2 VWFC domains.
"MUC-2 human small intestinal mucin gene structure. Repeated arrays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 APPROXIMATE REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         BERRY, MARIES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES, MARCES,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   major surface glycoprotein G - human respiratory syncytial virus (strain 8/60)
MyAlternate names: attachment glycoprotein G
Species: human respiratory syncytial virus
C;Becies: human respiratory syncytial virus
C;Bote: 31-Mar-1992 #sequence_revision 31-Mar-1992 #text_change 16-Jul-1999
C;Accession: A37077
S;Sullender, W.M.; Anderson, K.; Wertz, G.W.
Virology 178, 195-203, 1990
A;Title: The respiratory syncytial virus subgroup B attachment glycoprotein: analysis of a strict of the respiratory syncytial virus subgroup by the chance number: A37077; MUID:90357765; PMID:1697126
A;Reference number: A37077; MUID:90357765; PMID:1697126

Sequence 5, Application US/08928361B
Patent No. 6071518
GENERAL INFORMATION:
APPLICANT: Petersen, Carolyn
APPLICANT: Petersen, Carolyn
TITLE OF INVENTION: THEIR FUNCTIONAL MUTANTS, VARIANTS, ANALOGS AND FRAGMENTS
TITLE OF INVENTION: FOR TREATMENT AND DETECTION/DIAGNOSIS OF CRYPTOSPORIDIUM
TITLE OF INVENTION: SPECIES INPECTIONS
NUMBER OF SEQUENCES: 30

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1.                                                                                                          vector. The G protein gene into a non-replicating vector. The G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences immunoprotective ability. The resulting immunogenic composition will generate antibodies directed against the RSV G protein when administered to a host organism. The composition is useful as a continuise against RSV-associated disease, particularly resulting in a balanced Th/Thz immune response and for raising Ab, by usual immunisation and cell fusion methods. This truncated G protein is secreted since it lacks a transmembrane domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

A novel multimeric hybrid gene is used as a vaccine. The gene consists of two gene sequences which are linked and encode antigenic regions, these two sequences being derived from two different pathogens (parainfluenza virus (PIV) and respiratory syncitial virus (RsV)). The gene sequences that are particularly used are those which encode PIV-3 F and HN proteins (AAQ45683, AAQ45684) and RSV F and (Updated on 25-MAR-2003 to correct PN field.)

                                         The respiratory syncytial virus (RSV) G protein can be used in vaccines by inserting the G protein gene into a non-replicating vector. The G protein is placed under the control of alternative signal and expression sequences, for example the chimeric G protein produced may also comprise the signal peptide of tissue plasminogen activator (tPA). The recombinant vector may also comprise sequences immunoprotective ability. The resulting immunogenic composition will agenerate antibodies directed against the RSV G protein when administered to a host organism. The composition is useful as a vaccine to immunise against RSV-associated disease, particularly, by usual immunisation and cell fusion methods.
                                                                                                                                                                                                                                                           Gaps

AAQ29622-26. The proteins are F, G, 22K, 9.5K and major capsid protein N. The sequences and encoded proteins are useful for preparing vaccines against HRSV. The vaccines can be used to confer immunity against respiratory tract infections on human subjects. (Updated on 25-MAR-2003 to correct PF field.)

Compared to the state of the antigenic fragment. The virus may be administered in combination with an antivixal chemotherapeutic compound. Two or more viruses expressing different PWV proteins may be co-administered. Compositions comprising the virus are useful for eliciting a humoral and/or cellular immune response to a PMV in a mammal, particularly a human. Further a recombinant Sendai virus comprising an exogenous nucleic acid

encoding a second PMV protein is also administered and priming and/or boosting humoral or cellular immune response comprises administering one or more of a recombinant or isolated PMV protein or its antigenic fragment, a DNA vaccine encoding the same, and a non-Sendai viral vector encoding a PMV protein. The recombinant virus is useful as an effective vaccine against helv or SBV (the major causes of paediatric respiratory disease) and also to express any gene of interest in target cells, providing a positive medical impact on impaired cells, Mild-type globin gene transfer (i.e. gene therapy) into stem cells effects a cure for sickle cell disease or betathalssaemia. The recombinant virus may also prove effective in conferring immunity to human immunodeficiency virus (HIV) infection. The Sendai virus replicates at level that is high enough to induce sufficient immunity, but does not cause any harm to human recipient. The present esquence represents a respiratory syncytial virus (RSV) @ protein (heavily glycosylated protein), a PMV protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     67 HKVTPTTAIIQDATSQIKNTTPTYLTQNPQLGISPSNPSEITSQITTILASTTPGVKSTL 126

The diphtheria anatoxin peptide generates an immune response against any antigen coupled to it, and and has a negative, immediate hypersensitivity response. Diphtheria

Enterobacterium OmpA proteins, associated with an immunogenic peptide from R8V are used to prepare a nasal composition that induces a protective response, against R8V infection in the upper and lower (lung) respiratory tract. OmpA potentiates the immune response to some immunogenic peptides, eliminating the need for adjuvants. The method is useful for producing
anatoxin derived peptides, when modified to lack at least one cysteine residue, are useful as carrier peptides. Deletion of Cys residues in anatoxin peptides reduces formation of unwanted disulfide bridges. The peptides are used as a carrier for vaccines, particularly those for prevention or treatment of viral, bacterial, parasitic or fungal infections, or cancers and to generate, or increase, an immune response against infectious agents or tumour cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  OmpA; P40; enterobacteria; nasal composition; respiratory tract; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents a fusion protein comprising a peptide derived from the G protein of Respiratory syncytial virus (RSV) linked to a peptide derived from a diphtheria anatoxin. The diphtheria anatoxin peptide generates an immune response against any antigen coupled to it, and and has a negative, immediate hypersensitivity response. Diphtheria anatoxin derived peptides, when modified to lack at least one cysteine residue, are useful as carrier peptides. Deletion of cys residues in anatoxin peptides reduces formation of unwanted disulfide bridges. The peptides are used as a carrier for vaccines, particularly those for prevention or treatment of viral, bacterial, parasitic or fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response

The diphtheria anatoxin peptide generates an immune response against any antigen coupled to it, and and has a negative, immediate hypersensitivity response. Diphtheria anatoxin derived peptides, when modified to lack at least one cysteine residue, are useful as carrier peptides. Deletion of Cys residues in anatoxin peptides reduces formation of unwanted disulfide bridges. The peptides are used as a carrier for vaccines, particularly those for prevention or treatment of viral, bacterial, parasitic or fungal infectious, or cancers and to generate, or increase, an immune response against infectious agents or tumour cells.

The BB fragment is able to bind to human serum albumin and thereby enhance immunogenicity of any antigen, hapten or immunogen that is covalently coupled to it. In this specific example, the BB fragment was found to induce T helper memory cells, leading to production of anti-G2A antibodies by stimulated

The combination of the salt with the antigen or immunogen improves immunogenicity and equilibrates the Thl/Th2 immune response. The method is used for the treatment of respiratory syncytial virus infections. The present sequence represents a fusion protein, comprising an albumin binding domain of the G protein of Streptococcus sp. fused to a G protein fragment of respiratory syncytial long version). The fusion protein is used as an antigen in the method
                                                                                                                                                                                                                                                                                                                                Aliphatic ammonium salt; immunogen; antigen; syncytial virus infection;
                                                                                                                                                                                                                                                                                                      Amino acid sequence of fusion protein comprising 2 G protein fragments.

The sequence of the wild type amino acid residues 130-230 from the protein G of the respiratory syncytial virus (RSV) subgroups A. The sequence was used to synthesise the immunogenic peptides AAR88245-52 based on residues 174-187 of the subgroup A and B RSVs. The peptides are pref. conjugated to a novel carrier protein (the p40 protein; see AAR88257) derived from a membrane lipopolysaccharide (LPS) fraction from Klebsiella membrane LPSs with a divalent cation and detergents. Ribsiella membrane LPSs with a divalent cation and detergents, obtain an immunological adjuvant and linking the p40 protein to the above peptides. The conjugates are useful in the treatment of RSV A or B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
